

Edge list

All vertex objects are stored in an unordered list V , and all edge objects are stored in an unordered list E .

$$\begin{aligned} V &= \{v_1, v_2, v_3, v_4, v_5, v_6\} \\ E &= \{e_1, e_2, e_3, e_4, e_5, e_6\} \end{aligned}$$

Each v_i is an Vertex object that has element $x(\text{value})$ and also position of the vertex in V .

$$\begin{aligned} v_1 &\rightarrow (x = v_1.\text{value}, \text{pos} = 0) \\ v_2 &\rightarrow (x = v_2.\text{value}, \text{pos} = 1) \\ v_3 &\rightarrow (x = v_3.\text{value}, \text{pos} = 2) \\ v_4 &\rightarrow (x = v_4.\text{value}, \text{pos} = 3) \\ v_5 &\rightarrow (x = v_5.\text{value}, \text{pos} = 4) \\ v_6 &\rightarrow (x = v_6.\text{value}, \text{pos} = 5) \end{aligned}$$

Each e_i is an Edge object that has element $x(\text{value})$ and references to the vertex objects associated with the endpoint vertices of e_i . Also has A reference to the position of the edge instance in list E .

$$\begin{aligned} e_1 &\rightarrow (x = e_1.\text{value}, \text{associated} = (v_1, v_2), \text{pos} = 0) \\ e_2 &\rightarrow (x = e_2.\text{value}, \text{associated} = (v_2, v_4), \text{pos} = 1) \\ e_3 &\rightarrow (x = e_3.\text{value}, \text{associated} = (v_1, v_3), \text{pos} = 2) \\ e_4 &\rightarrow (x = e_4.\text{value}, \text{associated} = (v_3, v_4), \text{pos} = 3) \\ e_5 &\rightarrow (x = e_5.\text{value}, \text{associated} = (v_3, v_6), \text{pos} = 4) \\ e_6 &\rightarrow (x = e_6.\text{value}, \text{associated} = (v_3, v_5), \text{pos} = 0) \end{aligned}$$

Adjacency matrix

$$\begin{aligned} n &= 6 \\ -- &= \text{nullptr} \end{aligned}$$

$$\begin{aligned} v_1 &\rightarrow [--, e_1, e_3, --, --, --], \\ v_2 &\rightarrow [e_1, --, --, e_2, --, --], \\ v_3 &\rightarrow [e_3, --, --, e_4, e_6, e_5], \\ v_4 &\rightarrow [--, e_2, e_4, --, --, --], \\ v_5 &\rightarrow [--, --, e_6, --, --, --], \\ v_6 &\rightarrow [--, --, e_5, --, --, --], \end{aligned}$$

Adjacency list

For each vertex v , we maintain a collection $I(v)$, called the incidence collection of v , whose entries are edges incident to v .

$$V = \{v_1, v_2, v_3, v_4, v_5, v_6\}$$

$$\begin{aligned}v_1 &\rightarrow (x = v_1.\text{value}, I(v) = \{e_1, e_3\}, \text{pos} = 0) \\v_2 &\rightarrow (x = v_2.\text{value}, I(v) = \{e_1, e_2\}, \text{pos} = 1) \\v_3 &\rightarrow (x = v_3.\text{value}, I(v) = \{e_3, e_4, e_5, e_6\}, \text{pos} = 2) \\v_4 &\rightarrow (x = v_4.\text{value}, I(v) = \{e_2, e_4\}, \text{pos} = 3) \\v_5 &\rightarrow (x = v_5.\text{value}, I(v) = \{e_6\}, \text{pos} = 4) \\v_6 &\rightarrow (x = v_6.\text{value}, I(v) = \{e_5\}, \text{pos} = 5)\end{aligned}$$

Adjacency map

hash based map to implement $I(v)$ from above. we let the opposite endpoint of each incident edge serve as a key in the map, with the edge structure serving as the value.

$v_2:e_1 \rightarrow$ means that v_2 is key and hash of it will return e_1 as the value.

$$\begin{aligned}v_1 &\rightarrow (x = v_1.\text{value}, I(v)_\text{map} = \{v_2:e_1, v_3:e_3\}, \text{pos} = 0) \\v_2 &\rightarrow (x = v_2.\text{value}, I(v)_\text{map} = \{v_1:e_1, v_4:e_2\}, \text{pos} = 1) \\v_3 &\rightarrow (x = v_3.\text{value}, I(v)_\text{map} = \{v_1:e_3, v_4:e_4, v_5:e_6, v_6:e_5\}, \text{pos} = 2) \\v_4 &\rightarrow (x = v_4.\text{value}, I(v)_\text{map} = \{v_2:e_2, v_3:e_4\}, \text{pos} = 3) \\v_5 &\rightarrow (x = v_5.\text{value}, I(v)_\text{map} = \{v_3:e_6\}, \text{pos} = 4) \\v_6 &\rightarrow (x = v_6.\text{value}, I(v)_\text{map} = \{v_3:e_5\}, \text{pos} = 5)\end{aligned}$$
